Could Leptogenesis be tested ?

Leptogenesis \equiv Elegant solution to solve the matter - antimatter problem, but...

- for hierarchical N_R , $m_N > 10^8$ GeV
- for quasi-deg. N_R , Yukawa suppressed

\Rightarrow Difficulty to test leptogenesis !

If N_R part of Left-Right Symmetric model, then we also expect the presence of a W_R

Could Leptogenesis be tested ?

If N_R part of Left-Right Symmetric model, then we also expect the presence of a W_R

\Rightarrow What would be the consequences of the observation of a W_R at LHC ?

Effects of a TeV W_R :

New decay :

\Rightarrow Dilution & Washout

New scatterings :

New scatterings :

Efficiencies

For $\varepsilon_N = 1$, successful lepto requires $\eta > 7 \cdot 10^{-8}$

Could Leptogenesis be tested?

\Rightarrow Lepto ruled out if W_R detected at LHC
 \Rightarrow Lepto can be falsified

Bounds on m_{W_R} and m_N

\Rightarrow Successful leptogenesis if
 $(m_N, m_{W_R}) > (2.6, 1.8 \cdot 10^4)$ GeV [quasi-deg.]
 $(m_N, m_{W_R}) > (6 \cdot 10^8, 1 \cdot 10^{11})$ GeV [hierarch.]
